Question Label : Multiple Choice Question

The Reserve Bank of India (RBI) maintains a database of financial transactions carried out by various banks across the country. The database contains transaction records of varying magnitudes. The RBI decides to normalize the database to eliminate data redundancy and improve data integrity.

Original database structure:

Transaction$(Transaction\_ID, Bank\_Name, Bank\_Location, Amount, Date)$

The functional dependencies applicable to **Transaction** are:
$F = \{Bank\_Name \rightarrow Bank\_Location,$
$Transaction\_ID \rightarrow Amount, Date\}$

Normalized database structure:

Table 1: **Bank** $(Bank\_Name, Bank\_Location)$

Table 2: **Transaction** $(Transaction\_ID, Bank\_Name, Amount, Date)$

Which of the following normal forms has the RBI achieved by the new normalized database structure?

Options :

6406531958559. 1NF

6406531958560. 2NF

6406531958561. 3NF

6406531958562. BCNF

Question Label : Multiple Choice Question

The G20 is a global forum that brings together the world's major economies to discuss and cooperate on international economic and financial issues. The organizers of the G20 event have designed a database to store information about the participants, their countries, and the issues discussed.
The original database is
G20Participants (*Participant_ID*, *Participant_Name*, *Participant_Email*, *Participant_Country*, *Country_Leader_Name*, *Country_GDP*, *Issue_Discussed*)

The functional dependencies are:
F = {*Participant_ID* → *Participant_Name*, *Participant_Email*
Participant_Country → *Country_Leader_Name*, *Country_GDP*}

The initial design of the database is as follows:
Table 1:
Participants (*Participant_ID*, *Participant_Name*, *Participant_Email*)

Table 2:
Country (*Participant_Country*, *Country_Leader_Name*, *Country_GDP*, *Issue_Discussed*)

The database designers have identified that this design violates the third normal form (3NF) of database normalization.

Which of the following changes would bring the database design into 3NF?

Options :

6406531958563. Remove *Issue_Discussed* from **Country** and create a new table for the issues discussed and link it to the **Participants** and **Country** tables using a foreign key.

6406531958564. Create a new table for the issues discussed and link it to the **Participants** and **Country** tables using a foreign key.

6406531958565. Split the **Country** table into two tables, one for the issue discusses and the other for their respective countries.

6406531958566. Remove *Issue_Discussed* and add *Participant_ID* in **Country** table. And create a new table for the issues discussed and link it to the **Participants**.

Question Label : Multiple Choice Question

Consider the relational schema $\mathbf{R}(J, K, L, M, N)$
and the set of functional dependencies
$\mathcal{F} = \{$
$J \rightarrow K,$
$JK \rightarrow L,$
$M \rightarrow LJ,$
$MN \rightarrow JK$
$\}$
Which of the following functional dependency sets is
equivalent to the given set of functional dependencies?

Options :

6406531958580. $\mathcal{F} = \{J \rightarrow K, J \rightarrow L, M \rightarrow K, N \rightarrow K\}$

6406531958581. $\mathcal{F} = \{J \rightarrow L, M \rightarrow J, M \rightarrow K\}$

6406531958582. $\mathcal{F} = \{J \rightarrow K, J \rightarrow L, M \rightarrow K, MN \rightarrow K\}$

6406531958583. $\mathcal{F} = \{J \rightarrow K, J \rightarrow L, M \rightarrow J, MN \rightarrow K\}$

Question Label : Multiple Choice Question

Consider the relational schema $\mathbf{Z} = (P, Q, R, S, T, U, V, W, X)$ and has the set of functional dependencies $\mathrm{F} = \{ PQ \rightarrow R, P \rightarrow ST, U \rightarrow VW, Q \rightarrow U, S \rightarrow X \}$.

The relation $\mathbf{Z}$ is decomposed into three relations Z_1, Z_2, and Z_3 as

$Z_1 = \{ P,Q,R,S,T \}$

$Z_2 = \{ Q,U,V,W \}$

$Z_3 = \{ S, X \}$

This decomposition of Z is :

Options :

6406531958592. Lossless and dependency preserving

6406531958593. Lossless and not dependency preserving

6406531958594. Lossy and dependency preserving

6406531958595. Lossy and not dependency preserving

Question Label : Short Answer Question

Consider an instance of **student** Table in the **school_management** database.

roll_no	name	marks
1	Ram	50
2	Rakesh	65
3	Lily	45
4	Pranav	89
5	Emily	99

Table 1: **student**

After executing the Python code below, it is observed that the new tuple didn't get updated in the table. Check the code and find out the possible error and write it down. Note: Write the code in lowercase and without space. Just mention the command that is missing

```
import psycopg2
def insertrecord(roll,name,marks):
    conn=None
    try:
        conn=psycopg2.connect(database="school_management",
                              user="postgres",
                              password="root",
                              host="127.0.0.1",
                              port="5432")
        cur=conn.cursor() # create a new cursor
        cur.execute(''' insert into student
        values(%s,%s,%s)''',(roll,name,marks))
        #write down the code here
        cur.close()
    except(Exception, psycopg2.DatabaseError) as error:
        print(error)
    finally:
        if conn is not None:
            conn.close()
insertrecord(6,"Pranav",89)
```
