Module Summary

- Allows us to refer to a relation, (say  $E$ ) by more than one name.

$$\rho_X(E)$$

returns the expression  $E$  under the name  $X$

- Relations  $r$

$A$	$B$
$\alpha$	1

# Joining two relations – Natural Join

## Module 07

Partha Pratim  
Das

Objectives &  
Outline

Relational  
Operators

Aggregation  
Operators

Module Summary

- Let  $r$  and  $s$  be relations on schemas  $R$  and  $S$  respectively. Then, the “natural join” of relations  $R$  and  $S$  is a relation on schema  $R \cup S$  obtained as follows:
  - Consider each pair of tuples  $t_r$  from  $r$  and  $t_s$  from  $s$ .
  - If  $t_r$  and  $t_s$  have the same value on each of the attributes in  $R \cap S$ , add a tuple  $t$  to the result, where
    - ▷  $t$  has the same value as  $t_r$  on  $r$
    - ▷  $t$  has the same value as  $t_s$  on  $s$

Module Summary

Symbol (Name)	Example of Use
$\sigma$ (Selection)	$\sigma \text{ salary} > 85000 \text{ (instructor)}$ Return rows of the input relation that satisfy the predicate.
$\Pi$ (Projection)	$\Pi ID, salary \text{ (instructor)}$ Output specified attributes from all rows of the input relation. Remove duplicate tuples from the output.
$\times$ (Cartesian Product)	$instructor \times department$ Output pairs of rows from the two input relations that have the same value on all attributes that have the same name.
$\cup$ (Union)	$\Pi name \text{ (instructor)} \cup \Pi name \text{ (student)}$ Output the union of tuples from the two input relations.
$-$ (Set Difference)	$\Pi name \text{ (instructor)} - \Pi name \text{ (student)}$ Output the set difference of tuples from the two input relations.
$\bowtie$ (Natural Join)	$instructor \bowtie department$ Output pairs of rows from the two input relations that have the same value on all attributes that have the same name.
