- Join operations take two relations and return as a result another relation
- A join operation is a Cartesian product which requires that tuples in the two relations match (under some condition).
- It also specifies the attributes that are present in the result of the join
- The join operations are typically used as subquery expressions in the **from** clause

Types of Join between Relations

Views

View Expansion View Update Materialized Views • In some cases, it is not desirable for all users to see the entire logical model (that is, all the actual relations stored in the database.)

 Consider a person who needs to know an instructors name and department, but not the salary. This person should see a relation described, in SQL, by select ID, name, dept_name

from instructor

- A view provides a mechanism to hide certain data from the view of certain users
- Any relation that is not of the conceptual model but is made visible to a user as a "virtual relation" is called a **view**.

View Definition

Objectives Outline

Join Expressions
Cross Join
Inner Join
Outer Join
Left Outer Join
Right Outer Join
Full Outer Join

Views

View Expansion View Update Materialized Views A view is defined using the create view statement which has the form create view v as < query expression > where < query expression > is any legal SQL expression

- The view name is represented by v
- Once a view is defined, the view name can be used to refer to the virtual relation that the view generates
- View definition is not the same as creating a new relation by evaluating the query expression
 - Rather, a view definition causes the saving of an expression; the expression is substituted into queries using the view

Example Views

Module 13

Views

 A view of instructors without their salary create view faculty as select ID, name, dept_name from instructor

 Find all instructors in the Biology department select name

from faculty

where dept_name = 'Biology'

• Create a view of department salary totals **create view** departments_total_salary(dept_name, total_salary) **as** select dept_name, sum (salary) **from** instructor **group** by *dept_name*;

Views Defined Using Other Views

Module 13

Views

View Expansion
View Update
Materialized View

- One view may be used in the expression defining another view
- A view relation v_1 is said to depend directly on a view relation v_2 if v_2 is used in the expression defining v_1
- A view relation v_1 is said to depend on view relation v_2 if either v_1 depends directly on v_2 or there is a path of dependencies from v_1 to v_2
- A view relation v is said to be recursive if it depends on itself

Left Outer Join

Left Outer Join Right Outer Join Full Outer Join

View Expansion

View Update Materialized Views

1odule Summa

- A way to define the meaning of views defined in terms of other views
- \bullet Let view v_1 be defined by an expression e_1 that may itself contain uses of view relations
- View expansion of an expression repeats the following replacement step:

repeat

Find any view relation v_i in e_1 Replace the view relation v_i by the expression defining v_i until no more view relations are present in e_1

As long as the view definitions are not recursive, this loop will terminate

Update of a View

Module 13

Partha Pratim Das

Objectives Outline

Cross Join
Inner Join
Outer Join

Left Outer Join Right Outer Join Full Outer Join

View Expansion
View Update

Materialized Views

- Add a new tuple to faculty view which we defined earlier insert into faculty values ('30765', 'Green', 'Music');
- This insertion must be represented by the insertion of the tuple ('30765', 'Green', 'Music', null)
 into the *instructor* relation

Some Updates cannot be Translated Uniquely

Module 13

Partha Pratin Das

Objectives Outline

> Cross Join Inner Join Outer Join Left Outer Join Right Outer Join

Views
View Expansion
View Update
Materialized Views

• create view instructor_info as

select ID, name, building
from instructor, department
where instructor.dept_name= department.dept_name;

• insert into instructor_info values ('69987', 'White', 'Taylor');

- o which department, if multiple departments in Taylor?
- o what if no department is in Taylor?
- Most SQL implementations allow updates only on simple views
 - The **from** clause has only one database relation
 - The **select** clause contains only attribute names of the relation, and does not have any expressions, aggregates, or **distinct** specification
 - Any attribute not listed in the select clause can be set to null
 - The query does not have a group by or having clause

Database Management Systems Partha Pratim Das 13.27

And Some Not at All

Module 13

View Update

create view history_instructors as

select *

from instructor

where dept_name= 'History';

• What happens if we insert ('25566', 'Brown', 'Biology', 100000) into history_instructors?

Materialized Views

Module 13

Partha Pratin Das

Objectives Outline

Cross Join Inner Join Outer Join Left Outer Join

Left Outer Join Right Outer Join Full Outer Join

View Expansion View Update

Materialized Views

- Materializing a view: create a physical table containing all the tuples in the result of the query defining the view
- If relations used in the query are updated, the materialized view result becomes out of date
 - Need to maintain the view, by updating the view whenever the underlying relations are updated

Module Summary

Module 13

Module Summary

• Learnt SQL expressions for Join and Views
